A: To download Shader Model 3.0 Windows 7 Farming Simulator 2013 please click the link to download from the given below download link. Farming Simulator 2013 > General Discussions > Topic Details. i dont know is there a way to reinstall it i have windows 7. Chinese leaders promise tough fight to halt world's No. 1 carbon emissions LANGFORD, British Columbia -- Chinese authorities on Wednesday promised to keep the world's No. 1 carbon dioxide polluter on its feet and meet its emission targets in spite of global economic crises and a power outage that all but gutted its coal-fired power grid. Emission controls implemented since 2007 have already held China's annual average emissions constant and lowered the nation's annual growth rate to about 6% from 10% before those controls, China's State Council said in a statement. It didn't elaborate. The growth rate has fallen below growth rates in North America and Europe, but the report acknowledged that China was not fully addressing the climate impact of its growth. About 80% of Chinese emissions come from burning coal. The government is giving priority to a renewable energy and efficiency push, but governments and businesses have balked at the high-cost alternatives available now. "Along with the economic crisis and environmental protection problems, problems have emerged and will not be solved easily," the statement said. Yet there is no sign that China is willing to give up its leadership in energy, the statement said. The nation's energy intensity -- the amount of energy consumed per unit of gross domestic product -- peaked at 6,700 kilocalories per gross domestic product in 2005 and has declined by about 20% since then, the statement said. It said China's non-carbon energy intensity will keep going down by about 2% a year. China's energy intensity is lower than that of many economies around the world, but the government wants to improve efficiency standards nationwide in areas such as automobiles and refrigerators, the statement said. As part of its target to reduce emissions by 40% to 45% by 2020, China plans to speed up construction of renewable energy and energy-saving facilities. The government also will spend 5.4 trillion yuan (\$806 billion) to build "energy-saving vehicles" by 2020, give priority to some highly polluting industries, and expand some of its power generation, the statement said. Beijing has been under intense global pressure to cut emissions of the greenhouse gas
